# **Capstone Project - The Battle of Neighborhoods**

## **Location Analysis for Opening a New Restaurant in Cleveland**

Chia-Hung Kuo 18 May 2020

#### 1. Introduction

#### **Business understanding**

**Introduction** Greater Cleveland area is a fast-growing metropolitan area in northeast Ohio. Its 3.5 million residents make it one of the largest Ohio metro in giant Great Lakes Megalopolis. It is fast-growing fast because of the top-ranking universities, major healthcare systems and hospitals, and the balanced work-life lifestyle. The world-class museums and attractions draw approximately 2.5 million visitors annually. Therefore, it is a great place to start a new restaurant. Utilizing the analytic approach to conduct a market analysis is a great start.

**Project objectives:** Find a neighborhood with the population, household income, and lifestyle for starting a successful restaurant.

**Targeted Audience:** People who want to start a new restaurant in the greater Cleveland area.

**Problem:** Needs to be in a go-to neighborhood if people want to eat out and also have regular customers to support the business.

**Clear Question:** How to find the optimal location for the restaurant?

SOURCE: UNIVERSITY CIRCLE INC.

#### 2. Analytic approach:

We first analyze the income, population, and similiar business in the borough to obtain the insight of the neighborhood. Since the borough contains many cities, we perform further detailed analyses on the cities from the selected borough.

Using K-Means clustering to find out the groups of neighborhoods that seems to behave similarly to each other in the scale of borough level, and then narrow down to postal code (ZIP Code) areas.

#### 3. Data requirements

We need the county and city level of family income data and area population data with connected to county and city longitude and latitude information.

#### a. Data collections

The available data are obtained from Foursquare API, table from websites, and online databases:

- i. Foursquare API for the listing of greater Cleveland neighborhoods information with clustered venues through.
- ii. Ranking every Ohio city, county for median family income Census Snapshot by Data Central

https://www.cleveland.com/datacentral/2017/12/ranking every ohio city county 2.html

Median family income in Ohio cities ranges from a high of \$214,850 in the Columbus suburb of New Albany to below \$40,000 in 14 separate cities, according to new estimates released this month by the Census Bureau.

- iii. Great Cleveand Area Population Estimates by Cuyahoga County Planning Commission <a href="https://www.countyplanning.us/resources/census-data/population-estimates/">https://www.countyplanning.us/resources/census-data/population-estimates/</a> The Census Bureau's Population Estimates Program produces population estimates on an annual basis for the nation, states, counties, and communities using components of demographic change.
- iv. US Zip Code Latitude and Longitude by Open Data Soft https://public.opendatasoft.com/explore/dataset/us-zip-code-latitude-and-longitude/table/?refine.state=OH
  The data and approximate the great data and large it and a positive described.
  - The data set provides the matching latitude and longitude for the cities and states.
- v. ZIP Code Database by United States Zip Codes: <a href="https://www.unitedstateszipcodes.org/zip-code-database/">https://www.unitedstateszipcodes.org/zip-code-database/</a>
  This dataset provides a more detail insight into the demographics boundaries. It provides the boundary of Cuyahoga County with matched latitudes and longitudes, so that we could narrow down the searching area to only the northeast of Ohio state.

vi. Libraries: Pandas, Urllib, Geopy, Requests, Scikit Learn, and Folium

#### b. Data understanding/Visualization/Cleaning

To have the data's initial insights, understand the descriptive statistics, and have the visualization, we performed three steps. First, we load the files to the format of datafames and visuall check the datasets' summary information. Second, we performed the data cleaning include removing the missing or invalid values and eliminating duplicate cells. Then we remove the columns that are not needed in this project and then removing the NaN values that might cause problems. Third, we did the visualize the datasets to further under the trend and to see if they are suitable for the project. After cleaning, we combined multiple data sources of the needed data with the matching reference to the city and zip code into a dataframe for use through the project.

Table 1. The Family/Household income data

	Rank	City	2012-2016 Median family income	2007-2011 Median family income	2012-2016 Median household income	2007-2011 Median household income

Figure 2. The Greater Cleveland Area Population Estimates of 2018

Although Cleveland has the most population, the income is lower than the surrounded area. The possible reasons could be that Cleveland is a big district contains the most extended list of zip code cities among others, and therefore it has the most residents. For our purpose, we also need to consider that most people commute to work in downtown Cleveland and live in surrounded cities. Cleveland's great feature is that lots of traveling attractions are close to each other, and most of them are in forty minutes' drive from downtown Cleveland.

Table 3. US Zip Code Latitude and Longitude

#### 4. Results

By utilizing the geopy, Folium, and Foursquare libraries, we are able to obtain the location information of each neighborhood in greater Cleveland. The merged demographic data of neighborhoods is then fetched into a location dataframe. Then are fetched into venues near neighborhoods in the selected area through using Foursquare API. OneHotEncoding was also used for creating dummy variables for the venue category as the categorical variables. The K-Means cluster algorithm is used to classifying the neighbors into five groups. Finally, we repeated the previous process and narrow down the scope on a select area to look into the cities identified by zip codes. Finally, we will provide suggestions on choosing a location for our client. The map of the greater Cleveland area is created by using the Folium library with the location information from Nominatim and Foursquare.

Cleveland is one of the clusters with various types of restaurants, coffee shops, and bars. Also, its location is close to the center of the cluster, and therefore, we selected the neighbor, and look into the cities by the index of the zip codes. The results are shown in Figure 4.

Figure 4. Cluster of zip code cities of Cleveland area

The venues in the most significant cluster show that the locations are in the go-to places for people who want to dine out. As long as the new restaurant has a unique feature, there is still a great opportunity to be successful since it is in the area with people's flow.

### 5. Conclusion and Suggestions

Based on the analysis, we recommend to those who plan to open a new restaurant starting from considering the locations in cluster around the downtown Cleveland area. Then the next step will be thinking about the other factors such as the operating cost and so on. The demographics, accessibility, and labor costs, are also the important factors for opening a new restaurant.
